

COMICCRAFT

AI Comic Story Creator using Gemini Models

PROJECT DEMONSTRATION & PRESENTATION GUIDE

1. User Input	2. AI Outline	3. Story & Dialogue	4. Images	5. Preview / PDF
---------------	---------------	---------------------	-----------	------------------

This demonstration guide is adapted from the supplied project demonstration material and organized for a ComicCraft project presentation.

1. Demonstration Objective

Demonstrate the complete ComicCraft workflow from user story input through AI-generated comic content, illustration, preview and final PDF export.

The demonstration should show the interaction between the web interface, FastAPI backend, Gemini models, illustration generation and PDF creation.

2. Demo Step 1 — Launch

Command: `uvicorn app.main:app --reload`

Open the ComicCraft home page and identify the landing page, story-generation interface and fields for story prompt, character, setting, tone and art style.

3. Demo Step 2 — Create a Comic

Enter a sample story such as **“A brave fox exploring an enchanted forest.”** Select the character, setting, tone and art style, then submit the form.

The application processes the input and generates a panel-based comic. The project report describes a structured five-panel outline followed by story/dialogue generation and image generation.

4. Demo Step 3 — Explain the Result

Result Area	What to Demonstrate
Comic outline	Show the generated panel structure and sequence.
Story & dialogue	Show narration, captions and character dialogue.
Illustrations	Show the generated comic-style image for each panel.
Comic preview	Show how panel text and images are assembled together.

The supplied ComicCraft report states that the preview displays each panel with title, illustration, scene description, captions and narration.

5. Demo Step 4 — Change the Story Style

Change the tone or art style—for example, switch to a funny tone and comic-book art style. Demonstrate that the application can regenerate the outline, story and images according to the changed inputs.

6. Demo Step 5 — Export the Comic

After reviewing the preview, select the export/download option. The layout builder matches panel images with their corresponding stories and the PDF exporter compiles the comic into a multi-page PDF.

7. Technical Demonstration

Frontend: HTML, CSS and Jinja2 templates.

Backend: FastAPI for routing, input processing, AI workflow coordination, layout building and PDF export.

Story generation: Gemini Flash for structured panel outlines and Gemini Pro for detailed narration and dialogue.

Illustration: Stable Diffusion for comic-style images.

PDF: FPDF for multi-page comic export.

8. API / Verification Points

Use the FastAPI documentation at **/docs** to demonstrate the backend API. The supplied ComicCraft documentation also identifies routes for the homepage, comic generation, JSON generation/export and image testing.

Testing should verify valid inputs, correct route behavior, successful comic generation, image generation, preview rendering and successful PDF export. Invalid inputs and AI/API failures should be handled gracefully.

9. Closing Points

ComicCraft demonstrates an end-to-end AI-assisted comic creation workflow. Gemini models provide structured and creative storytelling, Stable Diffusion provides comic-style illustrations, and FastAPI connects the services to the interactive frontend and PDF export pipeline.

The supplied project report identifies future enhancement possibilities including user profiles, comic libraries and multi-page story arcs.
